

Program Assessment Report (PAR)

Environmental Sciences (ENVS) Doctoral Degree

REPORT PREPARED by: Cipollini, Don

ACADEMIC YEAR COVERED BY THIS REPORT: 2021-2022

I. PROGRAM LEARNING OUTCOMES

Over the course of Ph.D. studies, students in the program will learn scientific and technical skills appropriate for completing a doctoral research dissertation, which focuses on solving a particular environmental problem or addressing an important issue in environmental science. 1. Students will attain doctoral-level proficiency in the fundamental scientific area most closely aligned with their chosen research area (e.g., Environmental Biology, Chemistry, Earth Science, and/or Physics) as well as gain critical interdisciplinary problem solving skills through an interdisciplinary core curriculum and specialty courses. 2. Students will gain proficiency in the body of scientific literature pertaining to one or more key problems in environmental sciences and demonstrate competency in applying this knowledge to emerging issues. Successful attainment of the outcomes will be assessed through a preliminary examination usually occurring between years 1 and 2 of the program of study. 3. Students will gain skills in identifying new areas of concern in the environmental sciences, in proposing scientific investigations to better understand and/or characterize these areas of concern and in carrying out experimentation to test hypotheses centered on advancing the field of knowledge pertaining to the areas of concern. Assessment of these learning outcomes will take place through a written and oral defense of a novel research proposal. 4. Students will learn skills in analysis and interpretation of experimental data in the context of their chosen research problem as well as learn to draw conclusions based on these interpretations and while considering the relevant body of scholarly literature. Assessment of these outcomes will occur through the doctoral committee's evaluation of the student's written and oral defense of his/her dissertation.

II. PROCEDURES USED FOR ASSESSMENT

A. Direct Assessment

We examined oral and written performance on preliminary exams and proposal defenses for the students who attempted these important milestones during the year. We assessed graduating students at their defense using a defense rubric, and solicited exit surveys from them. We looked at other performance indicators in all students across the program, including numbers of papers, presentations, and outreach activities. The dissertation committees of each student perform many of these assessments, with the the program administrators doing the rest.

B. Scoring of Student Work

We first examine performance on the preliminary exam, which primarily addresses outcomes 2 of our current list. The preliminary exam is multifaceted. It consists of a ~25 page written paper on a topic assigned by the dissertation committee of the student. In the written document, students are asked to do a literature review on a topic related to the dissertation research, identify gaps in our knowledge, and propose approaches for addressing those gaps. The written component tests knowledge of content, critical thinking, hypothesis generation, experimental design, and writing ability. The students are also required to give an oral presentation of the exam and defend their work orally to the committee. Thus, it also tests the ability to produce an effective presentation, communicate orally, and answer questions on subjects pertinent to the student's scientific area of emphasis. The dissertation committee of five faculty members (including one external to Wright State) critically evaluates each component, providing a score of pass, fail, or defer subject to revision on both the oral and written component. We examined first-time passage rate and overall passage rate, and reviewed the comments provided by each committee in their reports to the program office. Occasionally, preliminary exam documents have been revised for publication as a review paper. We also assessed passage rates on proposal defenses which also assess components 3 of the program learning outcomes, and additionally, adds outcome which is more focused on technical or methodological aspects of a student's program. Finally, an overall assessment of the learning outcomes obtained by the student throughout their program is performed at the dissertation defense for each student. This addresses outcome 4 most closely. The dissertation committee assesses each student using an extensive rubric with each element on a four point scale. The rubric addresses nonverbal and verbal skills, enthusiasm, physical content, terminology, logic, data analysis and presentation, student knowledge, effectiveness and mechanics of the presentation and conclusions.

C. Indirect Assessment

All students are asked to submit an exit questionnaire at their graduation as an indirect assessment of student learning.

III. ASSESSMENT RESULTS/INFORMATION:

One student attempted the preliminary exam and passed the oral component, but was asked to revise aspects of the written document and thus were weaker in at least one aspect of the exercise. The student was successful with revisions. Two of two students passed their proposal defense during the reporting period. Scores on student exit surveys averaged 3.87/4 during the reporting period. The current overall average across all years is 3.49/4, indicating that satisfaction of recent graduates is slightly higher than the historical average. Scores on the defense assessment using our rubric averaged 2.85/3 for the four students who defended their dissertation during the reporting period, with a score of 3 indicating “exemplary” performance on an indicator. The current overall average is 2.5/3 across the nine years that we have utilized this tool. Data from 21/22 include:

All student attempting their preliminary exam or proposals passed during the reporting period. Students defending their dissertations have typically recieved high scores on the defense rubric that we administer, indicating excellent achievement of learning outcomes by our students, as judged by their disertation committees. Exit surveys of students indicate a high degree of satisfaction in the program by the students. While there is variation in productivity (e.g., papers, presentations, outreach, grant submissions) among students and discliplines represented in the program, there is a particularly high degree of productivity in many of our senior students as they near the end of their program that also extends for a year of two afterward. This is an important "stamp of approval" by the larger scientific community.

By all measures, our students are generally showing high attainment of desired learning outcomes.

IV. ACTIONS TO IMPROVE STUDENT LEARNING

Performance of our students has generally been commendable, and all students who attempted the preliminary exam or proposal defenses during the year were ultimately successful even if revision was necessary. Most current students are productive, although this varies somewhat from laboratory to laboratory, and graduating students have a very favorable view of the program. Should significant issues arise, we will address them as needed. We recognize that we had revised our program learning outcomes and those listed this year are our current learning outcomes. Results of this assessment will be shared with program faculty and administrators in online and in person forums. Suggested revisions to program learning outcomes were solicited via email and an overall view of the program assessmenr will be shared in a program faculty meeting.

V. SUPPORTING DOCUMENTS

Additional documentation, when provided, is stored in the internal Academic Program Assessment of Student Learning SharePoint site.
